

Hannaford Enterprise: Word was received from Fred Kimball Sunday from Rochester Minn. that Ingebret Simenson had undergone an operation on the preceding day for a tumor on the brain. He also stated that Mr. Simenson could not take ether, so the operation was rendered painless by "freezing" the affected part, and the patient was able to converse with the doctors all the time the operation was in progress. This is evidently a new wrinkle in medical science, and apparently is efficient, as Mr. Simenson stood the operation well.
