

The eclipse of the sun scheduled for last Saturday made its appearance just as advertised. The forenoon was cloudy and threatening, but in the afternoon it cleared up and about 5:00 o'clock the eclipse began to make its appearance. It appeared at first like a small circular piece taken out of the northern edge of the sun, like a bite taken out of a cookie. The eclipse lasted for about two hours and at its maximum the portion of the sun that was visible above the moon appeared like a crescent or new moon, considerably more than half of the sun being covered up. This eclipse was visible over practically the entire United States, and to people living in the stretch of country in a straight line between Aberdeen, Wash., and Orlando, Fla., the eclipse was total.
